1 INTRODUCTION

1.1 Introduction

LK Consult Ltd (LKC) has been commissioned by C W Nield to carry out a Preliminary Risk Assessment (PRA) for land at Hollins Farm, Bury. The PRA was undertaken in support of a planning application (reference number 55816) to redevelop the site for a residential end use.

According to guidance set out in CLR11¹, GPLC1-3² and the National Planning Policy Framework (NPPF)³ a PRA with a site reconnaissance is required as a minimum to ascertain if there is a potential contamination risk.

In accordance with current guidance the PRA report will include a site reconnaissance, site history, geology, hydrogeology, hydrology and a landfill search (within 250m of the site boundary). Information gathered from the desk study and site reconnaissance will be used to develop a contamination conceptual model for the site, which will support the identification and assessment of any pollutant linkages. Based on the findings of the PRA an appropriate site investigation can be derived, if required, once planning approval has been granted.

1.2 Background

A summary of site settings is presented in Table 1-1. Figures 1 and 2 indicate the site location and boundary. Figure 3 indicates the proposed development.

Location	South of Hollins Lane, in the area of Bury. National Grid Reference 381410E 408020N.
Area	0.26Ha.
Topography	Approximately 100 meters above ordnance datum (AOD). Site slopes down to the north east.
Land Use	<u>Site</u> The site is split into two areas: - Cobbled farmyard surrounded by farm buildings (barns) to the north and northwest. - Residential property to the east (farmhouse) with associated gardens to the east and south of the site. <u>Surrounding Area</u> North: Hollins Road. South: Bury Golf Course. East: Residential properties. West: Car park.
Proposed Development	Demolition of existing barns in the north and west and replacement with new residential housing (predominantly in the footprint of the previous buildings), including driveway and gardens. Farmhouse and associated gardens will remain relatively unchanged.

Table 1-1: Summary of site details for land at Hollins Farm, Bury.

2 SITE HISTORY

In compiling the site history, LKC consulted mapping and other environmental data provided by the Landmark Information Group Ltd. Copies of relevant historical plans are provided in Appendix A and are summarised Table 2-1. Notable features within 100m of the site boundary have been presented (distances will be approximate). The exception to this will be features within 250m that could be infilled historically.

Site Features	Location	Map Dates Present	Comments
Hollins House Farm	Whole site	1848- 2012	-Buildings to the north and west of the site, one building in the centre of the site. A number of small buildings to the west of the site are only marked until 1992 mapping. -Pump/ well marked on 1893 and 1910 mapping.
Surrounding Area Features	Distance/ Location	Map Dates Present	Comments
Residential	Adj. E & W	1848- 2012	-Properties to the east from 1893 mapping.
Pond	100m E	1851- 1955	-Potentially infilled by 1957 mapping.
Well	190m SW	1893- 1957	-Potentially infilled by 1963 mapping.
Embankment	10m E	1893- 1994	-Associated with Hollins Lane.
Bowling Green	65m N	1930- 2012	-Embankments marked adjacent to the north and south of the bowling green on 1957 mapping.
Drain	Adj. S	1957- 1992	-Running east-west parallel to the southern site boundary.
Drain	10m SE	1957- 2012	
Allotment Gardens	30m NW	1957	-Only annotated on this map. Residential properties on this site from 1970 mapping.
Pond	80m N	1965- 1974	-Potentially infilled by 1983 mapping.

Table 2-1: Summary of historical features for land at Hollins Farm, Bury.

3 ENVIRONMENTAL SETTING

In compiling this Section, LKC consulted environmental information provided by an Envirocheck Report (Appendix B), Natural England, the Coal Authority (Appendix C), the British Geological Survey (BGS) and the Environment Agency. A summary is presented in Table 3-1.

Summary of Environmental Settings			
Geology	Superficial		-Glaciofluvial Deposits of Sand and Gravel.
	Bedrock		-Carboniferous Pennine Middle Coal Measures.
	Faulting		-None within 250m.
	BGS logs		-None within 250m.
Hydrogeology	Aquifer Designation	Superficial	-Secondary A.
		Bedrock	-Secondary A.
	Groundwater abstractions		-None within 500m.
Hydrology	Nearest surface water		-Drains adjacent to south and approximately 30m south. -Parr Brook approximately 200m south.
	Flooding		-Not identified to be within a flood risk zone.
	Surface water abstractions		-None within 500m.
	Discharge consent		-Nearest 443m NE: Hexion Speciality Chemicals UK Ltd and Borden Chemicals (UK) Ltd; sewage disposal works.
	Pollution Incidents		-None within 250m.
Mining	Coal Mining Referral Area		-Standing Advice.
	Coal Report		-The property is not within the likely zone of physical influence on the surface from past underground workings. -No shafts present within 20m of the site.
	Mineral Abstraction		-3 sites within 1km. -Nearest 910m NE: Hollins Sand Pit, sand by opencast methods, operation ceased.
Ground Stability Hazards (on site)			-Potential for collapsible ground- very low hazard. -Potential for compressible ground– no hazard. -Potential for ground dissolution– no hazard. -Potential for landslide ground- very low hazard. -Potential for running sand- very low. -Potential for shrinking/ swelling clay– no hazard.
Landfill sites (within 250m)	Known/Registered		-None within 250m.
	Potential		-Well on site, potentially infilled by 1922 mapping. -2 ponds (80m N and 100m E). Nearest potentially infilled by 1983 mapping.
Radon			-Probability of <1% of homes above Action Level. -No further action required.
Designated Sites			-Adopted Green Belt 6m SE. -Local Nature Reserve 49m NE.
Contemporary Trade Directory			-None within 250m.

Table 3-1: Summary of environmental setting for land at Hollins Farm, Bury.

4 SITE RECONNAISSANCE

A site reconnaissance of the study site area was carried out by LKC on the 14th March 2013. Photographs are provided in Appendix D.

The site was accessed off Hollins Lane through a gate into the former farm yard (Appendix D, Photograph 1). The area of the proposed development is currently derelict farm buildings (Appendix D, Photographs 2 to 5). The site is bounded to the north by Hollins Lane, to the south by Bury Golf Course, by residential properties to the east and by a car park to the west. The site was observed to be slightly elevated above the surrounding land.

Ground cover across the site is mainly hardstood with cobbles in the farm yard. There were some areas of soft landscaping to the north east and south of the site, which are gardens for the existing property. There is a manhole cover towards the north west of the farm yard.

The farm yard buildings were in a state of disrepair and were not deemed safe for access. The building to the north west of the site was supported by scaffolding, as the south of the building had collapsed. There was an open door, to the north of the building, through which it could be seen that the building was empty. A wooden staircase could be seen to the north of this building, leading to a second floor.

No evidence of farm equipment or machinery was observed. There was evidence that a small fire had been set on the cobbles towards the north of the farm yard. Some wood was being stored in the farm yard, and a small box of rubbish. No fuel stains or leakages were noted within the farm yard. LKC saw no evidence of the well marked on historic mapping.

Anecdotal information from the tenant indicated that historically there may have been a tank(s) towards the north east of the site in the current garden area. Also, there used to be a culvert towards the north east of the site, which ran into fields to the north of the site. The culvert has been gone for some time, and no evidence of the former culvert can be observed on site.

There was evidence of some made ground towards the west of the site where a section of the farm yard building had collapsed. This comprised a sandy soil with some brick fragments and occasional ash.

5 PRELIMINARY CONCEPTUAL MODEL

5.1 Introduction

The aim of the conceptual model is to provide a preliminary assessment of the likelihood of a pollutant linkage for each potential combination of contaminant, pathway and receptor. A conceptual model can be used to make an informed decision on the contamination risks associated with the site and whether further site investigation work is required.

The Sections below are therefore divided into potential contaminant, potential pathway and potential receptor as described in CLR11⁴. The final Section provides an assessment of the potential pollutant linkages that may still be present on the site if redevelopment were to occur.

5.2 Potential Contaminants

Hollins House Farm has occupied the site since 1893 mapping, and the majority of farm buildings still remain on site associated with the farm yard. It is likely that some demolition of small buildings/ extensions has occurred historically.

There is a potential risk from hydrocarbon (fuel, oils, lubricants) contamination from potential tanks; machinery and vehicles which may have been historically stored/ maintained on site. There may also be a risk from algicides, pesticides and fungicides if the farm buildings were historically used for storage of these substances. The site reconnaissance did not identify any tanks; however, anecdotal evidence suggests that tanks may have been present towards the north east of the site.

Made ground was observed in the western area of the site comprising predominantly demolition rubble with some ash. Ash and clinker, from hearths and boilers, was often used historically as a level raising material. There may also be some made ground on site associated with the infilling of the well and former culvert. Contaminants may include heavy metals (such as arsenic and lead) and Polycyclic Aromatic Hydrocarbons (PAHs), such as benzo(a)pyrene (BaP)⁵. Depending upon the sulphate content of the combusted coal, soluble sulphate may also be generated. In addition, asbestos containing materials (ACMs) may be present associated with the current and former buildings onsite.

It should be noted that potential contamination is likely to be limited to the area of the former working areas of the farm i.e. the buildings, farm yard and the area of the tanks. Contaminants across the rest of the site including the current residential property and associated gardens are likely to be limited.

The immediate surrounding areas have been developed for residential usage to the east and west, Bury Golf Course to the south, and the land to the north remains undeveloped farm land. LKC do not consider that the surrounding areas will be a significant source of contamination to the site.

The Envirocheck Report has not identified any known/licensed landfill sites within 250m of the study site. A review of the historical OS mapping by LKC has identified two potentially

⁴ Defra (2004). "Model Procedures for the Management of Land Contamination." R&D Publication CLR 11

⁵ Defra (2002). "Potential Contaminants for the Assessment of Land." R&D Publication CLR 8

infilled ponds within 250m of the site. In addition, there is a potentially infilled well and culvert on site. There may also be a risk of ground gas to the site from the underlying coal measures.

Hazardous gas generation can also occur from made ground on the site; however, this is strongly dependent upon its quantity and composition. If significant amounts of putrescible or degradable material is found on site hazardous gas generation may be possible.

5.3 Potential Pathways

Principal potential pathways associated with human health from soil contamination are ingestion, dermal and inhalation. The current UK technical report document⁶ recognises ten such pathways comprising four ingestion, two dermal and four inhalation. These are listed as follows:

- Ingestion of soil
- Ingestion of soil-derived indoor dust
- Ingestion of contaminated vegetables
- Ingestion of soil attached to vegetables
- Dermal contact with soil
- Dermal contact with soil-derived indoor dust
- Inhalation of soil-derived outdoor dust
- Inhalation of soil-derived indoor dust
- Inhalation of vapours outside
- Inhalation of vapours inside

The proposed end-use follows a standard conceptual model of 'residential'. For this land use scenario all ten of the pathways will have to be considered.

Surface water and groundwater are principal mechanisms for the migration of contaminants, with rainwater infiltrating through contaminated material and contamination possibly going into solution. Contaminated water may then find preferential pathways to surface waters and underlying aquifer.

Culverts, ditches, drains, service drains may provide preferential pathways off site. During the site reconnaissance a manhole cover was noted towards the north west of the farm yard, and anecdotal information suggests that a culvert used to be present to the north east of the site. The former well identified on historic mapping may also be a pathway for contaminants.

Bedrock and superficial geology has the potential to impede or provide preferential pathways for contaminants onto or off site.

The study site may be located on glaciofluvial superficial deposits of Sand and Gravel. This deposit has the potential via pore space, to allow migration of contaminants onto or off site.

The site is situated on Pennine Middle Coal Measures of Mudstone, Siltstone and Sandstone. Depending on the pore space and bedding orientation, this may act as a pathway for contaminants onto or off-site.

There are no known geological faults within 250m of the study site.

⁶ EA (2008). "Updated Technical Background to the CLEA Model." Science Report – SC050021/SR3.

5.4 Potential Receptors

Potential receptors with respect to human health and hazards present on the site include:

- Human Health: Future site residents.
- Controlled Waters: Underlying Secondary A Aquifer and surface water.
- Buildings and Services: Organic/corrosive contaminants that could affect integrity of building materials and service pipes.
- Flora: Within future gardens.

It should be noted that there may be risk from short term exposure from contaminated soil to site workers. The Preliminary Contamination Conceptual Model deals with long term exposure to key receptors. Acute risks can be easily mitigated by good environmental management of the site during site works. Standard health and safety precautions (as per HSE guidance⁷) should be adopted by all workers involved with site enabling and construction works. Therefore, this receptor is not considered in the contamination conceptual model.

5.5 Preliminary Contamination Conceptual Model

The preliminary contamination conceptual model for Hollins Farm, Bury, is illustrated in Table 5-1 below and has identified seven generic potential pollutant linkages, seven of which are considered possible at this stage.

Each linkage is discussed below along with an assessment of the likelihood of each linkage considering the available data and the nature of the development. This conceptual model is based upon contaminant-pathway-receptor pollutant linkages, on the premise that if there is no pollutant linkage then there will be no risk to the receptor⁸.

Pollutant Linkage No.	Contaminant					Pathway	Receptor
	ACM	Gases		Contaminants			
		Hazardous	Ground	Organic	Inorganic		
PL1	?	x	x	?	?	-Dermal contact. -Ingestion of soils and vegetables. -Inhalation of soil, fibres and dust.	-Future site residents.
PL2	x	x	x	?	x	-Inhalation of vapours. -Vapour migration through permeable strata.	-Future site residents.
PL3	x	?	?	x	x	-Inhalation of hazardous/ ground gas. -Migration through permeable strata. -Explosion in confined spaces.	-Future site residents. -Building structure.
PL4	x	x	x	?	?	-Groundwater migration through permeable strata. -Perched waters migration on site.	-Secondary A Aquifer. -Surface water.
PL5	x	x	x	x	?	-Contact with potential hazards.	-Site buildings.
PL6	x	x	x	?	?	-Ingestion of tainted water supply. -Corrosion of metal pipework.	-Future site residents. -Pipework.
PL7	x	x	x	x	?	-Root uptake of phytotoxic contaminants.	-Flora in future landscaping.

Table 5-1 Contamination Conceptual Model for land at Hollins Farm, Bury.

(Key: ? – pollutant linkage possible; x – pollutant linkage unlikely)

⁷ HSE (1991). "Protection of workers and the general public during development of contaminated land" London HMSO.

⁸ EA (2004). "Model Procedures for the Management of Land Contamination." R&D Publication CLR 11

5.5.1 Pollutant Linkage 1

Pollutant linkage 1 refers to the potential asbestos, heavy metals and organic contaminants, such as PAHs and petroleum hydrocarbons coming into direct contact with future site residents. Given the former and current uses of the site, the potential contamination is expected to be predominantly in the north and north west areas of the site, associated with the working areas of the farm (yards, buildings and possible tanks), rather than the main farm house and gardens to the south and east.

5.5.2 Pollutant Linkage 2

Potential pollutant linkage 2 refers to possible inhalation of vapours from potential hydrocarbons onsite affecting the future site residents. Given the risk from hydrocarbons, this pollutant linkage is considered possible at this stage, in the areas to the north and west (buildings and farm yard areas) and to the north east (in the area of the former tanks). The farmhouse and gardens to the east and south of the site are unlikely to be affected.

5.5.3 Pollutant Linkage 3

Potential pollutant linkage 3 refers to possible hazardous gas from two infilled ponds offsite. This is considered unlikely due to the small size of these features, age (potentially infilled by the 1957 and 1983 mapping) and distance from the site. There is unlikely to be a significant amount of gas produced from the small features and any significant production is likely to have ceased given the infilled areas are over 30 years old. Hazardous gas may be generated onsite from the former culvert and well, or if large volumes of putrescible and degradable made ground are encountered.

There may be ground gas generation from the underlying Pennine Coal Measures.

At this stage pollutant linkage 3 with respect to hazardous and ground gas is considered to be possible.

5.5.4 Pollutant Linkage 4

Potential pollutant linkage 4 refers to the possible contaminants affecting surface waters and the underlying Secondary A Aquifer. This linkage is considered possible at this stage given the likely presence of made ground and possible localised hydrocarbon spillages on the study site migrating through the Sands and Gravel. In addition, the former well may provide a preferential pathway to the underlying aquifer.

5.5.5 Pollutant Linkage 5

Potential pollutant linkage 5 refers to the possible deleterious effects that sulphate may have on building materials such as concrete, water pipes and building structures. Potential made ground comprising ash and clinker may generate sulphate. Therefore, this pollutant linkage is considered possible at this stage.

5.5.6 Pollutant Linkage 6

Potential pollutant linkage 6 refers to the possible contaminants permeating potable water pipes and consumption by the future residents of the tainted water supply. Given the likely presence of made ground on site and likely contaminants, this linkage is also considered possible at this stage.

5.5.7 Pollutant Linkage 7

Potential pollutant linkage 7 refers to the possible phytotoxic contaminants affecting plant growth. Given the likely presence of made ground onsite and likely heavy metal contaminant, this linkage is also considered possible at this stage.

6 SUMMARY CONCLUSIONS AND RECOMMENDATIONS

6.1 Summary Conclusions

Based on the historical mapping the site has been the farm yard associated with Hollins Farm since 1848 mapping. A number of the original buildings associated with the farm yard are still on site, mainly to the north and north west of the site. Due to the age of the buildings, ACMs may be present.

Possible contamination was identified given the sites historic use as a Farm Yard, including hydrocarbons from former tanks; vehicle storage/ maintenance; heavy metals and sulphates from fuels and ash and clinker made ground; and possible algicides, fungicides and pesticides. It is likely that any contamination will be restricted to the farm yard and farm buildings towards the north and north west of the site. The area of the current farm house and associated gardens to the east and south of the site are unlikely to be significantly contaminated.

There are two small potentially infilled ponds within 250m of the site boundary which are not considered to be a hazardous gas risk to the site given their size, age of infilling and distance from the site. However, the former well and culvert may be a source of hazardous gas. The Envirocheck Report has not identified any known/ licenced landfill sites within 250m of the site. The underlying coal measures may be a source of ground gas. Therefore, hazardous gas and ground gas are both considered risks to the site. No radon protection measures are required.

The Coal Authority Report has not identified a risk from shallow coal mining, or any shafts within 20m of the site.

A risk to human health, structures (building and water pipes), the underlying Secondary A Aquifer, and flora within landscaping from potential soil contamination was identified and further investigation is recommended in the areas of the farm buildings, farm yard and the former tanks. The rest of the site is unlikely to be significantly contaminated.

The preliminary contamination conceptual model for Hollins Farm, Bury, as illustrated in Table 5-1 has identified seven generic potential pollutant linkages, seven of which are considered possible at this stage.

6.2 Recommendations

It is recommended that to support the planning application for this development, a Phase II intrusive survey should be carried out across the former 'working area' of the farm (yards, buildings and suspected tanks) to investigate the seven identified potential pollutant linkages further.

In order to address potential pollutant linkages, solid samples should be collected from trial pits and/or boreholes undertaken across the site subjected to appropriate chemical analyses based upon a broad range of contaminants, including those identified in Section 5.2. The investigation will follow guidance set out in BS10175⁹ and BS5930¹⁰. Some sampling locations will target historical features such as former and existing farm

⁹ British Standard (2011). "Investigation of Potentially Contaminated Sites – Code of Practice." BS10175:2011

¹⁰ British Standard (1999). "Code of Practice for Site Investigations." BS5930:1999

buildings, suspected tanks, the former well and culvert. Full details of the proposed site investigation should be forwarded to the Local Authority for approval.

Depending on the ground conditions encountered on site, it may be necessary to either carry out gas monitoring or to install precautionary gas protection measures.

If precautionary gas protection measures are to be installed and validated, they should be in line with the current standard document of gas control practice (C665¹¹ and BS8485:2007¹²). These should include as a minimum;

- Ventilation of confined spaces within the building.
- Well-constructed ground slab.
- Granular filled void, vented to the atmosphere or sub floor void.
- Low permeable membrane fitted by a professional contractor and validated by a third party.
- Minimum penetration of ground slab by services, with sufficient lapped and taped joints.

LKC would note that if significant putrescible or hydrocarbon impacted made ground is identified onsite it may be likely the membrane specification may need to be upgraded to a proprietary membrane or gas monitoring required.

The foundation design has not been provided to LKC at this time. We would advise that the foundation design follow BRE 414¹³ and drawings are provided to the Local Authority for approval. In addition, specifications of the proprietary gas membrane should be sent to the Local Authority for their approval.

It should be noted that local council and/ or NHBC may insist on ground gas monitoring. This normally requires the drilling of boreholes and installation of gas monitoring wells. As a minimum, gas monitoring would likely be over a three month period with at least six gas monitoring visits under various barometric conditions. The monitoring timescales will need to be agreed with the Local Authority prior to commencement.

It should be noted that boreholes or trial pits may also be utilised to provide appropriate geotechnical information on sub-surface conditions.

Pollutant linkage 4 may be investigated by the sampling and chemical analysis of any groundwater on site or by testing for any leachable contamination in the soils on site. This will be dependent upon prevailing site conditions.

This investigation, in conjunction with appropriate geotechnical testing, will delineate any existing areas of potential contamination and identify and characterise any contaminants encountered. Information from this investigation can then be used to provide a more detailed assessment of the identified pollutant linkages, provide appropriate foundation solutions and, if necessary, identify appropriate remedial measures to ensure that the site is made suitable for its proposed end use.

A more detailed scope should be presented to the Local Authority as a Site Investigation Brief.

¹¹ CIRIA (2007). "Assessing Risks Posed by Hazardous Ground Gases to Buildings." CIRIA C665

¹² BSI (2007). "Code of Practice for the Characterisation and Remediation from Ground Gas in Affected Developments." BS8485:2007.

¹³ BRE (2001). "Protective Measures for Housing on Gas-Contaminated Land." BRE 414.

LKC would recommend that a copy of this report is forwarded to the Local Authority for their approval of the above recommendations before the commencement of any works on the site. LKC would advise that a more detailed site investigation proposal be provided to the local authority for their approval.

6.3 Further Considerations

Even though no asbestos was identified externally on the existing buildings there may be areas inside that have Asbestos Containing Materials (ACMS) given the age of the properties. Therefore we would advise that a Pre-Demolition and Major Refurbishment Asbestos Survey is undertaken prior to demolition by a professional contractor. The LK Group have a designated Asbestos Department would be happy to advise you on the appropriate steps to take in order to have the building suitably surveyed.

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.

They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping

Published 2006

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Additional SIMs

Published 1985

Source map scale - 1:1,250

The SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1992

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1994 - 1996

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.

For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Non-Residential Coal Authority Mining Report

SITE AT HOLLINS FARM, 247 HOLLINS LANE, BURY, LANCASHIRE,

This report is based on and limited to the records held by, the Coal Authority, and the Cheshire Brine Subsidence Compensation Board's records, at the time we answer the search.

Coal mining	See comments below
Brine Compensation District	No

Information from the Coal Authority

Underground coal mining

Past

According to the records in our possession, the property is not within the zone of likely physical influence on the surface from past underground workings.

Present

The property is not in the likely zone of influence of any present underground coal workings.

Future

The property is not in an area for which the Coal Authority is determining whether to grant a licence to remove coal using underground methods.

The property is not in an area for which a licence has been granted to remove or otherwise work coal using underground methods.

The property is not in an area that is likely to be affected at the surface from any planned future workings.

However, reserves of coal exist in the local area which could be worked at some time in the future.

No notice of the risk of the land being affected by subsidence has been given under section 46 of the Coal Mining Subsidence Act 1991.

Mine entries

There are no known coal mine entries within, or within 20 metres of, the boundary of the property.

Coal mining geology

The Authority is not aware of any evidence of damage arising due to geological faults or other lines of weakness that have been affected by coal mining.

Opencast coal mining

Past

The property is not within the boundary of an opencast site from which coal has been removed by opencast methods.

Present

The property does not lie within 200 metres of the boundary of an opencast site from which coal is being removed by opencast methods.

Future

The property is not within 800 metres of the boundary of an opencast site for which the Coal Authority is determining whether to grant a licence to remove coal by opencast methods.

The property is not within 800 metres of the boundary of an opencast site for which a licence to remove coal by opencast methods has been granted.

Coal mining subsidence

The Coal Authority has not received a damage notice or claim for the subject property, or any property within 50 metres, since 31st October 1994.

There is no current Stop Notice delaying the start of remedial works or repairs to the property.

The Authority is not aware of any request having been made to carry out preventive works before coal is worked under section 33 of the Coal Mining Subsidence Act 1991.

Mine gas

There is no record of a mine gas emission requiring action by the Coal Authority within the boundary of the property.

Hazards related to coal mining

The property has not been subject to remedial works, by or on behalf of the Authority, under its Emergency Surface Hazard Call Out procedures.

Withdrawal of support

The property is not in an area for which a notice of entitlement to withdraw support has been published.

The property is not in an area for which a notice has been given under section 41 of the Coal Industry Act 1994, revoking the entitlement to withdraw support.

Working facilities orders

The property is not in an area for which an Order has been made under the provisions of the Mines (Working Facilities and Support) Acts 1923 and 1966 or any statutory modification or amendment thereof.

Payments to owners of former copyhold land

The property is not in an area for which a relevant notice has been published under the Coal Industry Act 1975/Coal Industry Act 1994.

Information from the Cheshire Brine Subsidence Compensation Board

The property lies outside the Cheshire Brine Compensation District.

Additional Remarks

This report is prepared in accordance with the Law Society's Guidance Notes 2006, the User Guide 2006 and the Coal Authority and Cheshire Brine Board's Terms and Conditions 2006. The Coal Authority owns the copyright in this report. The information we have used to write this report is protected by our database right. All rights are reserved and unauthorised use is prohibited. If we provide a report for you, this does not mean that copyright and any other rights will pass to you. However, you can use the report for your own purposes.
