

How to add the address search tool ('Gazetteer') for MapInfo v17

- 1) Load MapInfo via Remote Desktop
- 2) Click "Tool Extensions" under the Home tab

- 3) On the new Tools sidebar click "Options" and then "Register Tool"

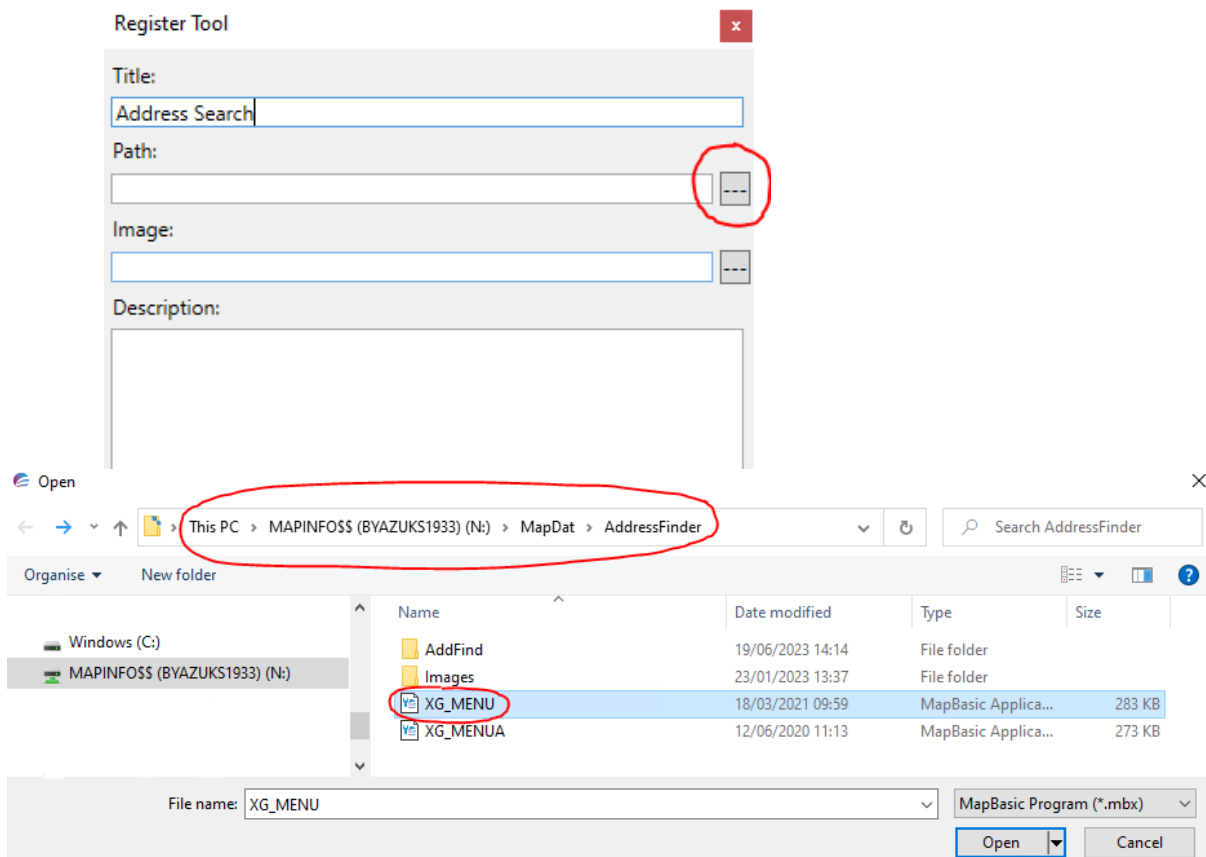

- 4) Give it the Title of "Address search". In the Path copy and paste the following:

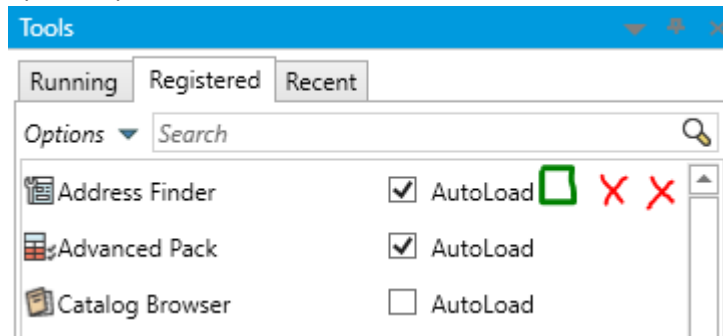

N:\MapDat\AddressFinder\XG_MENU.MBX

OR you can click the button on the right and find the file as shown below.

The Image and Description are left blank and press "OK"

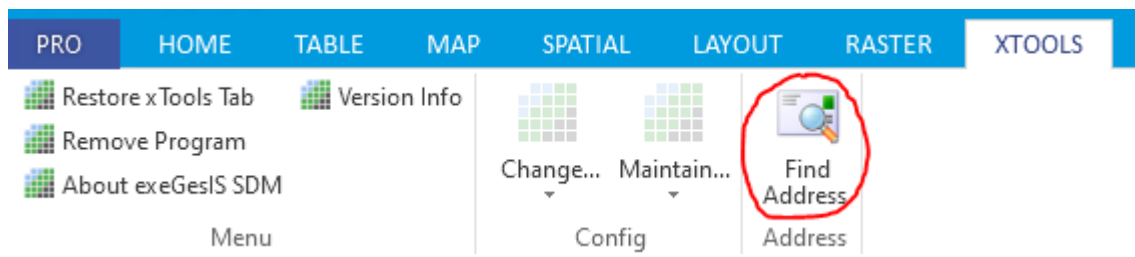

- 5) Then click on the Registered tab of the Tools sidebar. The new address search will be top of the list. Tick the “AutoLoad” box – this will mean that it is automatically added each time you open MapInfo.

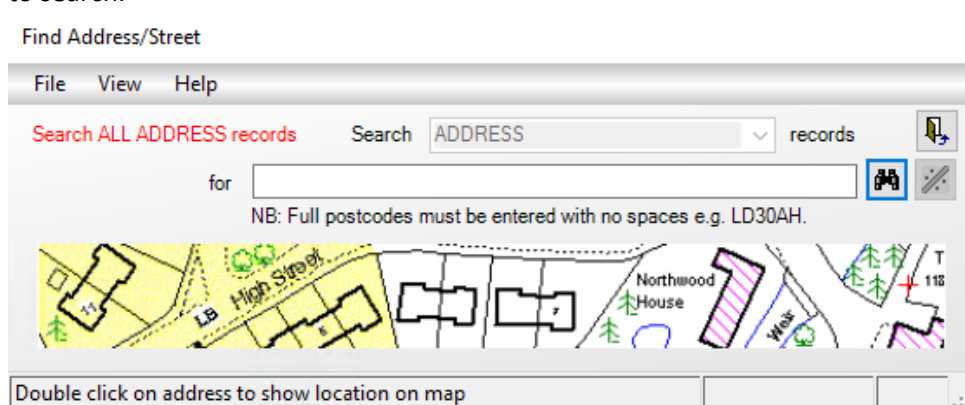

- 6) When hovering over the Address Search 3 buttons will appear on the right. Click the first one (Captioned “Load tool (Run)” when hovered over). This will add the XTOOLS tab to the top of your screen. You can now close the Tools sidebar.

- 7) When you have data or a workspace open, click on the XTOOLS tab and then (single) click on Find Address.

- 8) This will open up the address search tool. Type the address, or part of, into the text box. As noted – postcodes are without the space in the middle. Press enter or the binoculars button to search.

- 9) Double click on the address from the list to zoom to that location. To close the address search tool click on the door button in the top right.
- 10) The address search tool places a star point in the cosmetic layer where the address is. This can be deleted if not needed by editing the cosmetic layer.
