

Window Reveal Details - 19 Prestwich Park Road South

The window reveal is the width of one brick thick plus some mortar on all windows. The exact depth varies, including within a single window, but a typical depth is 12 – 15cm. It is not proposed to make a significant change to the depth of the reveal – I would still expect it to be one brick thick plus some mortar, but the exact depth may be slightly different. On average I would expect the depth to decrease slightly due to the slightly greater thickness of vacuum glazed windows vs single glazed windows. However, this difference will be significantly less than if standard double-glazing was being utilised.

I have included below photographs of typical reveals:
